Zoho Company Selection Process

Zoho is a software company that started in 1996 and has its main office in Chennai. It hires many fresh graduates every year, and it cares more about your skills than your marks. The selection process for freshers usually has about five rounds. The first round is a written test with aptitude and logical reasoning questions. Some drives also add C programming questions, like finding the output of a small program. Only the students who clear this round move to the next one.

The next two rounds are programming rounds. Here you must write full working code on a computer, and pseudo code is not accepted. The first one is basic, and the second one is harder and often asks you to build a small application, such as a library or parking system. After this, you face a technical interview where they ask about data structures, algorithms, object oriented ideas and databases, and they may ask about your projects too. The last round is the HR interview, where they check your communication, your attitude and your interest in Zoho. To prepare well, practice coding daily, stay calm, and explain your thinking clearly.
